Muhammad Zubair Zafar

San Francisco, CA | (217) 790 8056 | zubairzafar480@gmail.com | github.com/zubair480 | linkedin.com/in/zubair480

Founding engineer building LLM agents and the evals that test them. Full-stack in Python and TypeScript. 10x hackathon winner.

EXPERIENCE

Founding Engineer, Andever AI (Stealth) San Francisco, CA | Jun 2026 – Present

- Sole engineer at a longevity-AI startup, working directly with the founder, investors and prospective customers.
- Built the v0 engine and MCP server in TypeScript, validated on mock patient data. It ingests lab PDFs, CGM exports and wearable data, flags abnormal biomarkers, groups them by aging mechanism and drafts a protocol where every item cites graded evidence.
- Enforced a clinician-approval gate in the core engine: delivery is refused until a clinician approves. Dangerous lab values always produce a referral and contraindicated items are blocked.
- Shipped it with 787 tests and a blind eval that passed 34 of 34 hash-locked tasks. Fuzzing with 1,240 invalid inputs per transport caused zero crashes, and p95 latency is under 500 ms on every tool.

Software Engineer (Graduate Assistant), Eastern Illinois University Charleston, IL | Aug 2024 – May 2026

- Shipped an enterprise HR system in Laravel for 7,000+ users and cut API response time 65% through query tuning and indexing.
- Automated request workflows with Twilio SMS and REST APIs, reducing manual entry 40% and speeding request processing 25%.
- Rewrote a 2006-era PHP application from the ground up in Laravel. Reliability rose 35% after the migration.

Backend Software Engineer, WPBrigade Dec 2023 – Aug 2024

- Developed and maintained 5+ production plugins with 15,000+ combined active installs, including custom REST API endpoints, webhook integrations and database schema optimization.
- Wrote a PHP theme framework that lets 200+ non-technical users build sites without code. Deployment time fell 60%.

Software Engineering Intern, Etihad Aviation Group Abu Dhabi, UAE | Sep 2023 – Oct 2023

- Turned a hackathon-winning IATA cargo message (CPM) parser into a production tool (Python, Flask, regex). Manual processing fell 30% and data-entry errors 95%.

RESEARCH

Graduate Research Assistant, Eastern Illinois University Charleston, IL | Aug 2025 – May 2026

- Trained YOLOv8 classifiers in PyTorch on 80,000+ labeled MRI scans, reaching 97.2% test accuracy and 95.8% F1.
- Built preprocessing and augmentation (rotation, flip, scale) and moved training to Colab Pro GPUs, cutting training time 70%.

SELECTED PROJECTS

34 projects at zubair480.github.io/projects

RefundGuard | 1st place, The Executable World hackathon, SF | GitHub | Live report Sep 2026

- Release gate that attacks an AI refund agent in a simulated store with 11 scam personas and 3 honest customers, scored by ledger replay in code plus a quote-verified LLM judge. Version 1 leaked $310 and promised $709 in writing. By version 3, 0 of 11 breached.

Thermal Crusoe | 1st place ($5,000), Crusoe x The AI Conference hack day, SF | GitHub Sep 2026

- On a team of 4, built the three.js 3D thermal twin of a motor control center room (simulated data) and owned the Next.js APIs and app integration. A 180-request evaluation of the Crusoe-hosted model passed every check at about 681 ms median.

Attest | 2nd place, solo, Agent Native Builders at Cloudflare SF | GitHub Aug 2026

- Agent-to-agent vendor security review (separate Cotal agents and credentials) that accepts only evidence-backed answers. Each claim passes a deterministic severity counter and an LLM relevance judge, and disagreements escalate to a person.

EstateAgent AI | HackIllinois 2026 | GitHub | Live demo Mar 2026

- Built a map-reduce agent pipeline on Modal with parallel analyst agents (Qwen 2.5 on vLLM, H100s) and FastAPI. Streamed progress over WebSockets on Cloudflare Durable Objects and ran 5,000 Monte Carlo simulations in under 12 s.

PayeeLock | AI Security Hackathon SF | GitHub Sep 2026

- Defense for an AI accounts-payable agent against email fraud. Agent-written code runs in a Wasmer sandbox with no network, and a ledger that never reads email decides payments. The demo paid the legitimate $48,250 invoice and blocked the spoofed one.

SKILLS

AI / ML: LLM agents (CrewAI, LangGraph, MCP), evals, LLM-as-judge, RAG, LLM APIs (OpenAI, Anthropic), PyTorch
Full stack: Python, TypeScript, JavaScript, SQL, PHP, FastAPI, Flask, Node.js, React, Next.js, Laravel, REST APIs, WebSockets, PostgreSQL, MySQL, MongoDB, Neo4j, Redis
Infra and tools: Docker, CI/CD, Cloudflare Workers and Durable Objects, Modal GPUs, Supabase, Convex, Wasmer sandboxing, Claude Code and Codex, automated tests

EDUCATION

M.S. Computer Information Technology, Eastern Illinois University | GPA 4.0 | Fully funded scholarship Aug 2024 – May 2026
B.S. Computer Science, Government College University Faisalabad Oct 2019 – Sep 2023
Other hackathon wins (team): 1st place: YC Haunted Hacks, MongoDB, Amadeus (Etihad). 2nd place: CrewAI, Auth0 x Stripe at Okta, B.E.L.L.E. (+ 2 tracks). 3rd place: Build an Agent.
Teaching: Section Leader, Stanford Code in Place (CS106A), 3 cycles, 2023 – 2025, selected from thousands of applicants.
